

## Interpreting Coefficients & Feature Importance

Bookmark this page

With a KNN model it is difficult to understand exactly what the relationship is between a feature and the response. But for linear models we can begin to understand this relationship by interpreting the model parameters!

Recall that these model parameters are the beta coefficients we learn when we fit our model.

When we have a large number of predictors:  $\mathbf{X}_1, \dots, \mathbf{X}_p$ , there will be a large number of model parameters,  $\beta_0, \beta_1, \dots, \beta_p$ .

Looking at all values of  $\beta$  as a list of numbers is impractical, so we visualize these values in a feature importance graph.

The feature importance graph above shows which predictors have the most impact on the model's prediction. Not only does it tell use about the magnitude of their impact but the sign on the parameter also tells us the direction of the relationship. We'll see in later sections however that such a naïve approach to coefficient interpretation may not be giving us the whole story. But this is a good place to start!
